Protect Yo' Data

Cell Phone Edition

Data on your cell phone is encrypted.

But the protection is only as good as your unlock code.

Make your unlock code at least 10 letters long. Random words make an easy-to-remember phrase:

Make a random phrase on dicepass.org

unfold – photocopy – distribute

(cc) BY-NC-ND

Even locked, not all your data is protected.
Address books and recent messages are unencrypted.

EVERYTHING is encrypted when your phone is **OFF**.

Practice powering off your phone in your pocket to keep your data safe as you approach unsafe places.

10 letter passcodes are annoying to type.

Use a fingerprint lock in safe spaces.
Disengage the fingerprint lock when you aren't (by using the wrong finger repeatedly).

Practice doing this in your pocket.

Turn off message previews.

Anyone who nabs your phone can read them!

Keep yourself (and your data) safe out there!

Your unlock code only protects your data if your phone is locked!
